

Pawpals — Kickstarter Handout

Find trusted caretakers for the pets people love.

Next.js + Tailwind CSS + Supabase • Prepared June 24, 2026

The Big Picture

Pawpals is a **two-sided marketplace**: pet owners book care, and caretakers offer services. The foundation — database, security, sign-up/login, and page layout — is **built and tested**. Your job from here is to build the service & booking features on top of the starter scaffolding (every starter file has `STARTER` / `TODO` comments to guide you and any AI helper).

✓ Done So Far

Foundation & setup

- ✓ Next.js (App Router) + Tailwind, responsive layout
- ✓ Supabase connection helpers (browser + server)
- ✓ Preview mode — runs even without Supabase keys
- ✓ Pushed to GitHub + Vercel deploy guide in README

Database (run `supabase/schema.sql`)

- ✓ 7 tables created with relationships
- ✓ Row Level Security rules on every table
- ✓ 5 services pre-loaded
- ✓ Auto-creates a profile on sign-up

Working features

- ✓ Sign up (owner or caretaker) & log in / log out
- ✓ Protected dashboard (redirects if logged out)
- ✓ Homepage with the 5 services
- ✓ Starter pages: browse caretakers + profile

Your Database Tables

Table	Holds
<code>profiles</code>	Every user (owner / caretaker)
<code>caretaker_profiles</code>	Bio, experience, rating
<code>pets</code>	An owner's pets
<code>services</code>	The 5 service types (filled)
<code>caretaker_services</code>	Services offered + price
<code>bookings</code>	Owner → caretaker requests
<code>reviews</code>	Star ratings per booking

First-Run Checklist

- 1 Create a Supabase project
- 2 Run `supabase/schema.sql` in SQL Editor
- 3 Copy `.env.local.example` → `.env.local`, add your keys
- 4 Turn OFF "Confirm email" while building
- 5 `npm install` then `npm run dev`
- 6 Open `localhost:3000`

Go Live when ready

- ☐ Sign up at `vercel.com` with GitHub
- ☐ Import the `pawpals` repo
- ☐ Add the 2 Supabase env vars in Vercel
- ☐ Deploy → get your `.vercel.app` link
- ☐ Set Site URL in Supabase auth settings

Full steps are in the README. After this, every `git push` auto-updates your site.

Your To-Do List build these next

1. Caretaker services & prices ~ start here

- ☐ Let caretakers pick which services they offer
- ☐ Set a price for each (saves to `caretaker_services`)
- ☐ Show services + prices on the profile page

2. Booking flow ~ the core feature

- ☐ "Book" form on a caretaker's page (date, pet, notes)
- ☐ Save request to `bookings` (status = pending)
- ☐ Caretaker accepts / declines from dashboard
- ☐ Owner sees status update

3. Pet management (owners)

- ☐ Add / edit / remove pets (`pets` table)
- ☐ Pick a pet when booking

4. Search & filtering

- ☐ Filter caretakers by service type
- ☐ Search by city / location
- ☐ Sort by rating

5. Reviews & ratings

- ☐ Owner leaves a rating after a completed booking
- ☐ Update caretaker's average rating
- ☐ Show reviews on the profile

6. Profile polish

- ☐ Edit profile (name, city, photo, bio)
- ☐ Upload avatars (Supabase Storage)

Later when ready to launch

- ☐ In-app payments (Stripe)
- ☐ Messaging between owner & caretaker
- ☐ Email / push notifications

How to Build Each To-Do With AI

Tackle **one item at a time** and test it in the browser before moving on. When you ask an AI for help, tell it: *"This is a Next.js App Router + Supabase project. Use the helpers in `src/Lib/supabase/`, and paste the matching table from `supabase/schema.sql` plus the relevant **STARTER** page. That gives it everything it needs to write code that fits your project.*
